

SCC-AFTER

Questionnaire on skin SCC radiotherapy

The SCC-After trial has been funded by HTA NIHR. It is a RCT for patients with completely excised skin SCC with randomisation to clinical monitoring versus postoperative RT (to primary/surgical site). The RT will be delivered with electrons. The trial is currently in the set-up stage and the trial group have developed a facility questionnaire in order to better understand current radiotherapy practice in the UK.

The group would like to ask you to complete this questionnaire. If you are willing to do so please follow the below link. Information given should relate to current local practice for the trial group of patients at your centre. Please note that by completing the questionnaire there is no commitment to participate in the trial (page 1 of the questionnaire relates to trial but we are aware that some centres may not recruit so please disregard the trial specific content. Page 3 also asks for trial contacts which may not be required, the most important contact is the person completing the form and perhaps the responsible clinical oncologist).

To save progress of the Facility Questionnaire without signing in to google account, please continue to the end of the Facility Questionnaire, select 'Submit' and select option 'Edit your response'. Sharing the URL allows others to edit your response. Save this URL in a secure location to continue later or share it with colleagues via email.
